

Package ‘AMMISbP’

July 20, 2018

Type Package

Title Additive Main Effects and Multiplicative Interaction Model Stability Parameters

Version 0.0.0.9000

Description Computes various stability parameters from Additive Main Effects and Multiplicative Interaction (AMMI) analysis results such as Modified AMMI Stability Value (MASV), Sums of the Absolute Value of the Interaction Principal Component Scores (SIPC), Sum Across Environments of Genotype-Environment Interaction Modelled by AMMI (AMGE), Sum Across Environments of Absolute Value of Genotype-Environment Interaction Modelled by AMMI (AV_(AMGE)), AMMI Stability Index (ASI), Modified ASI (MASI), AMMI Based Stability Parameter (ASTAB), Annicchiarico's D Parameter (DA), Zhang's D Parameter (DZ), Averages of the Squared Eigenvector Values (EV), Stability Measure Based on Fitted AMMI Model (FA), Absolute Value of the Relative Contribution of IPCs to the Interaction (Za). Further calculates the Simultaneous Selection Index for Yield and Stability from the computed stability parameters. See the vignette for complete list of citations for the methods implemented.

AMGE . AMMI

Sum Across Environments of GEI Modelled by AMMI

Description

AMGE.AMMI computes the Sum Across Environments of Genotype-Environment Interaction (GEI) Modelled by AMMI (AMGE) (Sneller et al., 1997) considering all significant interaction principal components (IPCs) in the AMMI model. Using AMGE, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
AMGE.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when <code>method = "rao"</code> (See SSI).

Details

The Sum Across Environments of GEI Modelled by AMMI (*AMGE*) is computed as follows:

$$AMGE = \sum_{j=1}^E \sum_{n=1}^{N'} \lambda_n \gamma_{in} \delta_{jn}$$

Where, N' is the number of significant IPCs (number of IPC that were retained in the AMMI model via F tests); λ_n is the singular value for IPC n and correspondingly λ_n^2 is its eigen value; γ_{in} is the eigenvector value for i th genotype; and δ_{jn} is the eigenvector value for j th environment.

Value

A data frame with the following columns:

AMGE	The AMGE values.
SSI	The computed values of simultaneous selection index for yield and stability.
rAMGE	The ranks of AMGE values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

ASI.AMMI

*AMMI Stability Index***Description**

ASI.AMMI computes the AMMI Stability Index (ASI) (Jambhulkar et al., 2014; Jambhulkar et al., 2015; Jambhulkar et al., 2017) considering the first two interaction principal components (IPCs) in the AMMI model. Using ASI, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
ASI.AMMI(model, ssi.method = c("farshadfar", "rao"), a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The AMMI Stability Index (*ASI*) is computed as follows:

$$ASI = \sqrt{[PC_1^2 \times \theta_1^2] + [PC_2^2 \times \theta_2^2]}$$

Where, PC_1 and PC_2 are the scores of 1st and 2nd IPCs respectively; and θ_1 and θ_2 are percentage sum of squares explained by the 1st and 2nd principal component interaction effect respectively.

Value

A data frame with the following columns:

ASI	The ASI values.
SSI	The computed values of simultaneous selection index for yield and stability.
rASI	The ranks of ASI values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

Description

ASTAB.AMMI computes the AMMI Based Stability Parameter (ASTAB) (Rao and Prabhakaran, 2005) considering all significant interaction principal components (IPCs) in the AMMI model. Using ASTAB, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
ASTAB.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The AMMI Based Stability Parameter value (*ASTAB*) is computed as follows:

$$ASTAB = \sum_{n=1}^{N'} \lambda_n \gamma_{in}^2$$

Where, N' is the number of significant IPCAs (number of IPC that were retained in the AMMI model via F tests); λ_n is the singular value for IPC n and correspondingly λ_n^2 is its eigen value; and γ_{in} is the eigenvector value for i th genotype.

Value

A data frame with the following columns:

ASTAB	The ASTAB values.
SSI	The computed values of simultaneous selection index for yield and stability.
rASTAB	The ranks of ASTAB values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

AVAMGE.AMMI

Sum Across Environments of Absolute Value of GEI Modelled by AMMI

Description

AVAMGE.AMMI computes the Sum Across Environments of Absolute Value of GEI Modelled by AMMI (AVAMGE) (Zali et al., 2012) considering all significant interaction principal components (IPCs) in the AMMI model. Using AVAMGE, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```

AVAMGE.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)

```

Arguments

model	The AMMI model (An object of class AMMI generated by AMMI).
n	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
alpha	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
ssi.method	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
a	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Sum Across Environments of Absolute Value of GEI Modelled by AMMI (*AVAMGE*) is computed as follows:

$$AV_{(AMGE)} = \sum_{j=1}^E \sum_{n=1}^{N'} |\lambda_n \gamma_{in} \delta_{jn}|$$

Where, N' is the number of significant IPCs (number of IPC that were retained in the AMMI model via F tests); λ_n is the singular value for IPC n and correspondingly λ_n^2 is its eigen value; γ_{in} is the eigenvector value for i th genotype; and δ_{jn} is the eigenvector value for j th environment.

Value

A data frame with the following columns:

AVAMGE	The AVAMGE values.
SSI	The computed values of simultaneous selection index for yield and stability.
rAVAMGE	The ranks of AVAMGE values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

DA.AMMI

Annicchiarico's D Parameter

Description

DA.AMMI computes the Annicchiarico's D Parameter values (D_a) (Annicchiarico, 1997) considering all significant interaction principal components (IPCs) in the AMMI model. It is the unsquared Euclidean distance from the origin of significant IPC axes in the AMMI model. Using D_a , the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
DA.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.

alpha	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
ssi.method	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
a	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Annicchiarico's D Parameter value (D_a) is computed as follows:

$$D_a = \sqrt{\sum_{n=1}^{N'} (\lambda_n \gamma_{in})^2}$$

Where, N' is the number of significant IPCAs (number of IPC that were retained in the AMMI model via F tests); λ_n is the singular value for IPC n and correspondingly λ_n^2 is its eigen value; and γ_{in} is the eigenvector value for i th genotype.

The Yield Stability Index (YSI) is computed as follows:

Value

A data frame with the following columns:

DA	The DA values.
SSI	The computed values of simultaneous selection index for yield and stability.
rDA	The ranks of DA values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

DZ.AMMI

Zhang's D Parameter

Description

DZ.AMMI computes the Zhang's D Parameter values or AMMI statistic coefficient or AMMI distance or AMMI stability index (D_Z) (Zhang, 1998) considering all significant interaction principal components (IPCs) in the AMMI model. It is the distance of IPC point from origin in space. Using D_Z , the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
DA.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when <code>method = "rao"</code> (See SSI).

Details

The Zhang's D Parameter value (D_z) is computed as follows:

$$D_z = \sqrt{\sum_{n=1}^{N'} \gamma_{in}^2}$$

Where, N' is the number of significant IPCAs (number of IPC that were retained in the AMMI model via F tests); and γ_{in} is the eigenvector value for i th genotype.

Value

A data frame with the following columns:

DZ	The DZ values.
SSI	The computed values of simultaneous selection index for yield and stability.
rDZ	The ranks of DZ values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

EV.AMMI

Averages of the Squared Eigenvector Values

Description

EV.AMMI computes the Sums of the Averages of the Squared Eigenvector Values (EV) (Zobel, 1994) considering all significant interaction principal components (IPCs) in the AMMI model. Using EV, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
EV.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Averages of the Squared Eigenvector Values (*EV*) is computed as follows:

$$EV = \sum_{n=1}^{N'} \frac{\gamma_{in}^2}{N'}$$

Where, N' is the number of significant IPCs (number of IPC that were retained in the AMMI model via F tests); and γ_{in} is the eigenvector value for i th genotype.

Value

A data frame with the following columns:

EV	The EV values.
SSI	The computed values of simultaneous selection index for yield and stability.
rEV	The ranks of EV values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

```

Description

FA.AMMI computes the Stability Measure Based on Fitted AMMI Model (FA) (Raju, 2002) considering all significant interaction principal components (IPCs) in the AMMI model. Using FA, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
FA.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Stability Measure Based on Fitted AMMI Model (*FA*) is computed as follows:

$$FA = \sum_{n=1}^{N'} \lambda_n^2 \gamma_{in}^2$$

Where, N' is the number of significant IPCs (number of IPC that were retained in the AMMI model via F tests); λ_n is the singular value for IPC n and correspondingly λ_n^2 is its eigen value; and γ_{in} is the eigenvector value for i th genotype.

When N' is replaced by 1 (only first IPC axis is considered for computation), then the parameter *FP* can be estimated (Zali et al., 2012).

$$FP = \lambda_1^2 \gamma_{i1}^2$$

When N' is replaced by 2 (only first two IPC axes are considered for computation), then the parameter *B* can be estimated (Zali et al., 2012).

$$B = \sum_{n=1}^2 \lambda_n^2 \gamma_{in}^2$$

When N' is replaced by N (All the IPC axes are considered for computation), then the parameter estimated is equivalent to Wricke's ecovalence (Wricke, 1962; Zali et al., 2012).

$$W_{(AMMI)} = \sum_{n=1}^N \lambda_n^2 \gamma_{in}^2$$

Value

A data frame with the following columns:

FA	The FA values.
SSI	The computed values of simultaneous selection index for yield and stability.
rFA	The ranks of FA values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

MASI.AMMI

Modified AMMI Stability Index

Description

MASI.AMMI computes the Modified AMMI Stability Index (MASI) considering all significant interaction principal components (IPCs) in the AMMI model. Using MASI, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```

MASI.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)

```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Modified AMMI Stability Index (*MASI*) is computed as follows:

$$MASI = \sqrt{\sum_{n=1}^{N'} PC_n^2 \times \theta_n^2}$$

Where, PC_n are the scores of n th IPC; and θ_n is the percentage sum of squares explained by the n th principal component interaction effect.

Value

A data frame with the following columns:

MASI	The MASI values.
SSI	The computed values of simultaneous selection index for yield and stability.
rMASI	The ranks of MASI values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

b <- MASI.AMMI(model, n = 2)

identical(a$ASI, b$MASI)
```

MASV.AMMI	<i>Modified AMMI Stability Value</i>
-----------	--------------------------------------

Description

MASV.AMMI computes the Modified AMMI Stability Value (MASV) (Zali et al., 2012; Please see **Note**) from a modified formula of AMMI Stability Value (ASV) (Purchase et al. 1997). This formula calculates AMMI stability value considering all significant interaction principal components (IPCs) in the AMMI model. Using MASV, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
MASV.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Modified AMMI Stability Value (*MASV*) is computed as follows:

$$MASV = \sqrt{\sum_{n=1}^{N'-1} \left(\frac{SSIPC_n}{SSIPC_{n+1}} \times PC_n \right)^2 + (PC_{N'})^2}$$

Where, $SSIPC_1, SSIPC_2, \dots, SSIPC_n$ are the sum of squares of the 1st, 2nd, ..., and n th IPC; and PC_1, PC_2, \dots, PC_n are the scores of 1st, 2nd, ..., and n th IPC.

The Yield Stability Index (*YSI*) is computed as follows:

$$YSI = R_{MASV} + R_Y$$

Where, R_{MASV} is the MASV rank of the genotype and R_Y is the mean yield rank of the genotype.

Value

A data frame with the following columns:

MASV	The MASV values.
SSI	The computed values of simultaneous selection index for yield and stability.
rMASV	The ranks of MASV values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

Note

In Zali et al., (2012), the formula for both AMMI stability value (ASV) was found to be erroneous, when compared with the original publications (Purchase 1997; Purchase et al., 1999; Purchase et al., 2000).

ASV (Zali et al., 2012)

$$ASV = \sqrt{\left(\frac{SSIPC_1}{SSIPC_2}\right) \times (PC_1)^2 + (PC_2)^2}$$

ASV (Purchase 1997; Purchase et al., 1999; Purchase et al., 2000)

$$ASV = \sqrt{\left(\frac{SSIPC_1}{SSIPC_2} \times PC_1\right)^2 + (PC_2)^2}$$

The authors believe that the proposed Modified AMMI stability value (MASV) in Zali et al., (2012) is also erroneous and have implemented the corrected one in MASV.AMMI.

MASV (Zali et al., 2012)

$$MASV = \sqrt{\sum_{n=1}^{N'-1} \left(\frac{SSIPC_n}{SSIPC_{n+1}}\right) \times (PC_n)^2 + (PC_{N'})^2}$$

SIPC.AMMI	<i>Sums of the Absolute Value of the IPC Scores</i>
-----------	---

Description

SIPC.AMMI computes the Sums of the Absolute Value of the IPC Scores (ASI) (Sneller et al., 1997) considering all significant interaction principal components (IPCs) in the AMMI model. Using SIPC, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
SIPC.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
  a = 1)
```

Arguments

model	The AMMI model (An object of class AMMI generated by AMMI).
n	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
alpha	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
ssi.method	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
a	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Sums of the Absolute Value of the IPC Scores (*SIPC*) is computed as follows:

$$SIPC = \sum_{n=1}^{N'} |\lambda_n^{0.5} \gamma_{in}|$$

OR

$$SIPC = \sum_{n=1}^{N'} |PC_n|$$

Where, N' is the number of significant IPCs (number of IPC that were retained in the AMMI model via F tests); λ_n is the singular value for IPC n and correspondingly λ_n^2 is its eigen value; γ_{in} is the eigenvector value for i th genotype; and PC_1, PC_2, \dots, PC_n are the scores of 1th, 2th, ..., and n th IPC.

The closer the SIPC scores are to zero, the more stable the genotypes are across test environments.

Value

A data frame with the following columns:

SIPC	The SIPC values.
SSI	The computed values of simultaneous selection index for yield and stability.
rSIPC	The ranks of SIPC values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

 SSI

Simultaneous Selection Indices for Yield and Stability

Description

SSI computes the Simultaneous Selection Index for Yield and Stability (SSI) according to the methods specified in the argument method.

Usage

```
SSI(y, sp, gen, method = c("farshadfar", "rao"), a = 1)
```

Arguments

y	A numeric vector of the mean yield/performance of genotypes.
sp	A numeric vector of the stability paramter/index of the genotypes.
gen	A character vector of the names of the genotypes.
method	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See Details).
a	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See Details).

Details

The SSI proposed by Rao and Prabhakaran (2005) (I_i) is computed as follows:

$$I_i = \frac{\bar{Y}_i}{\bar{Y}_{..}} + \alpha \frac{\frac{1}{SP_i}}{\frac{1}{T} \sum_{i=1}^T \frac{1}{SP_i}}$$

Where SP_i is the stability measure of the i th genotype under AMMI procedure; Y_i is mean performance of i th genotype; $Y_{..}$ is the overall mean; T is the number of genotypes under test and α is the ratio of the weights given to the stability components (w_2) and yield (w_1) with a restriction that $w_1 + w_2 = 1$. The weights can be specified as required.

α	w_1	w_2
1.00	0.5	0.5
0.67	0.6	0.4
0.43	0.7	0.3
0.25	0.8	0.2

The SSI proposed by Farshadfar (2008) is called the Genotype stability index (GSI) or Yield stability index (YSI) (Farshadfar et al., 2011) and is computed by summation of the ranks of the stability index/parameter and the ranks of the mean yields.

$$GSI = YSI = R_{SP} + R_Y$$

Where, R_{SP} is the stability parameter/index rank of the genotype and R_Y is the mean yield rank of the genotype.

Value

A data frame with the following columns:

SP	The stability parameter values.
SSI	The computed values of simultaneous selection index for yield and stability.
rSP	The ranks of the stability parameter.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.

ZA.AMMI

*Absolute Value of the Relative Contribution of IPCs to the Interaction***Description**

ZA.AMMI computes the Absolute Value of the Relative Contribution of IPCs to the Interaction (Za) (Zali, 2012) considering all significant interaction principal components (IPCs) in the AMMI model. Using Za, the Simultaneous Selection Index for Yield and Stability (SSI) is also calculated according to the argument `ssi.method`.

Usage

```
ZA.AMMI(model, n, alpha = 0.05, ssi.method = c("farshadfar", "rao"),
a = 1)
```

Arguments

<code>model</code>	The AMMI model (An object of class AMMI generated by AMMI).
<code>n</code>	The number of principal components to be considered for computation. The default value is the number of significant IPCs.
<code>alpha</code>	Type I error probability (Significance level) to be considered to identify the number of significant IPCs.
<code>ssi.method</code>	The method for the computation of simultaneous selection index. Either "farshadfar" or "rao" (See SSI).
<code>a</code>	The ratio of the weights given to the stability components for computation of SSI when method = "rao" (See SSI).

Details

The Absolute Value of the Relative Contribution of IPCs to the Interaction (D_{Za}) is computed as follows:

$$Za = \sum_{i=1}^{N'} |\theta_n \gamma_{in}|$$

Where, N' is the number of significant IPCAs (number of IPC that were retained in the AMMI model via F tests); γ_{in} is the eigenvector value for i th genotype; and θ_n is the percentage sum of squares explained by n th principal component interaction effect.

Value

A data frame with the following columns:

Za	The Za values.
SSI	The computed values of simultaneous selection index for yield and stability.
rZa	The ranks of Za values.
rY	The ranks of the mean yield of genotypes.
means	The mean yield of the genotypes.

The names of the genotypes are indicated as the row names of the data frame.
